

Global Orchid Diversity in the Mediterranean Biome: identifying hotspots and exploring automated extinction risk assessment with deep neural networks

Lussu, Scaccabarozzi, Brundett, Santi, Silvestro, Chiarucci

Presenter: Michele Lussu

Three Key Challenges in Conservation

Biodiversity is complex and multidimensional: species richness, functional and phylogenetic diversity

Collecting and analyzing biodiversity data is time-consuming and resource-intensive.

The biodiversity crisis is urgent, requiring faster and more effective action

Three Key Challenges in Conservation

Biodiversity is complex and multidimensional, involving genetic, species, functional, and ecosystem diversity.

Collecting and analyzing biodiversity data is time-consuming and resource-intensive.

AI IN CONSERVATION BIOLOGY

KEY APPLICATIONS

- Extinction risk prediction
- Trait imputation, data gap filling
- Prioritization of protected area
- Trend detection

PRO

- Handles complex datasets
- Accelerates decision-making

CONS

- Dependent on data quality
- Requires validation
- Cannot replace expert judgment

Contributed Paper

Automated conservation assessment of the orchid family with deep learning

automated methods can significantly improve the speed and scope of extinction risk assessments for highly diverse groups like orchids

AIMS

01
Identify orchid hotspots, combining species richness, functional, and phylogenetic diversity accross Mediterranean Biome

02
Predict extinction risk of unassessed species using neural network

03
Identify conservation priority areas in Mediterranean Biome

THE MEDITERRANEAN BIOME

Hotspot of plant diversity

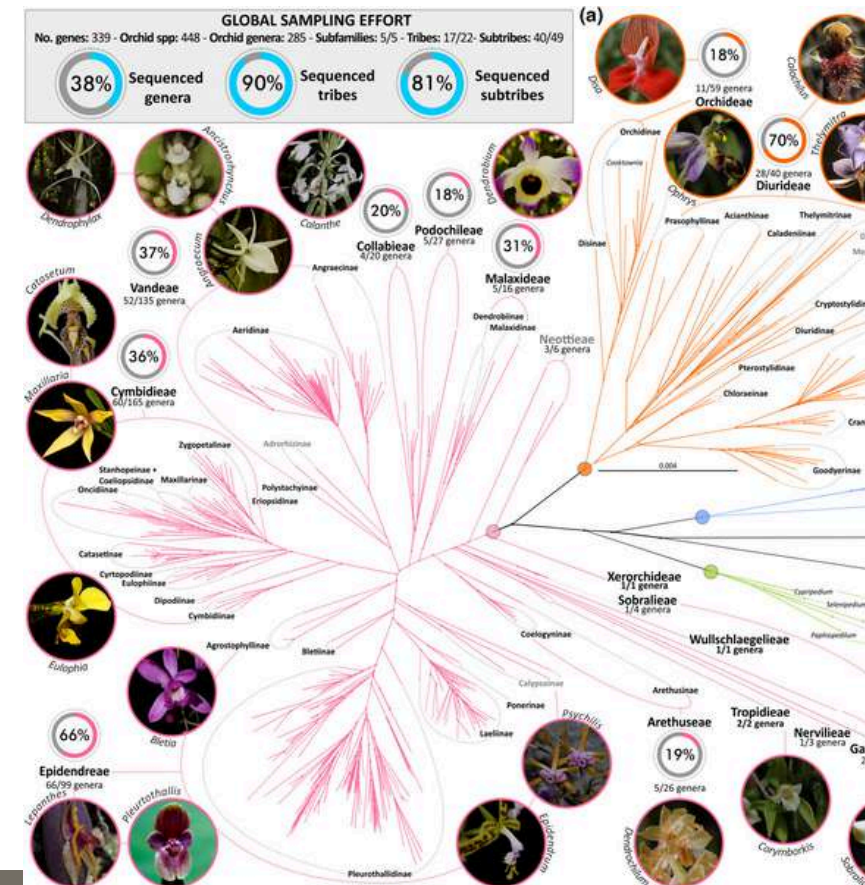

2% of the world surface is covered by the Mediterranean biome, it harbours more than 20% of the plant diversity

An orchidologically well-explored biome

The Mediterranean biome is among the most botanically explored, with extensive floristic and taxonomic research

WHY ORCHIDS?

target species

28.000 species
world wide

Extensive
literature

Recent
phylogeny.

Perez-Escobar 2024

DATA WORKFLOW

- **Download species occurrences** from GBIF for the Mediterranean Biome.
- Standardize taxonomy according to Plants of the World Online (POWO).
- **Retrieve official IUCN Red List** assessments via [iucnredlist.org](https://www.iucnredlist.org).
- **Compile functional traits from published literature and expert sources.**

Diversity metrics

- Occurrence data linked to TDWG Level 4. (**species richness**)
- **FD** computed using Gower distance (traits used: trophism, pollination strategy, growth form, fire response)
- Phylogenetic tree pruned to target species (picante) (**FD**)

The need of a rigorous global standard for assessing species extinction risk to train AI.

Key Strengths:

- Scientifically robust
- Globally recognized
- Essential for conservation planning and policy

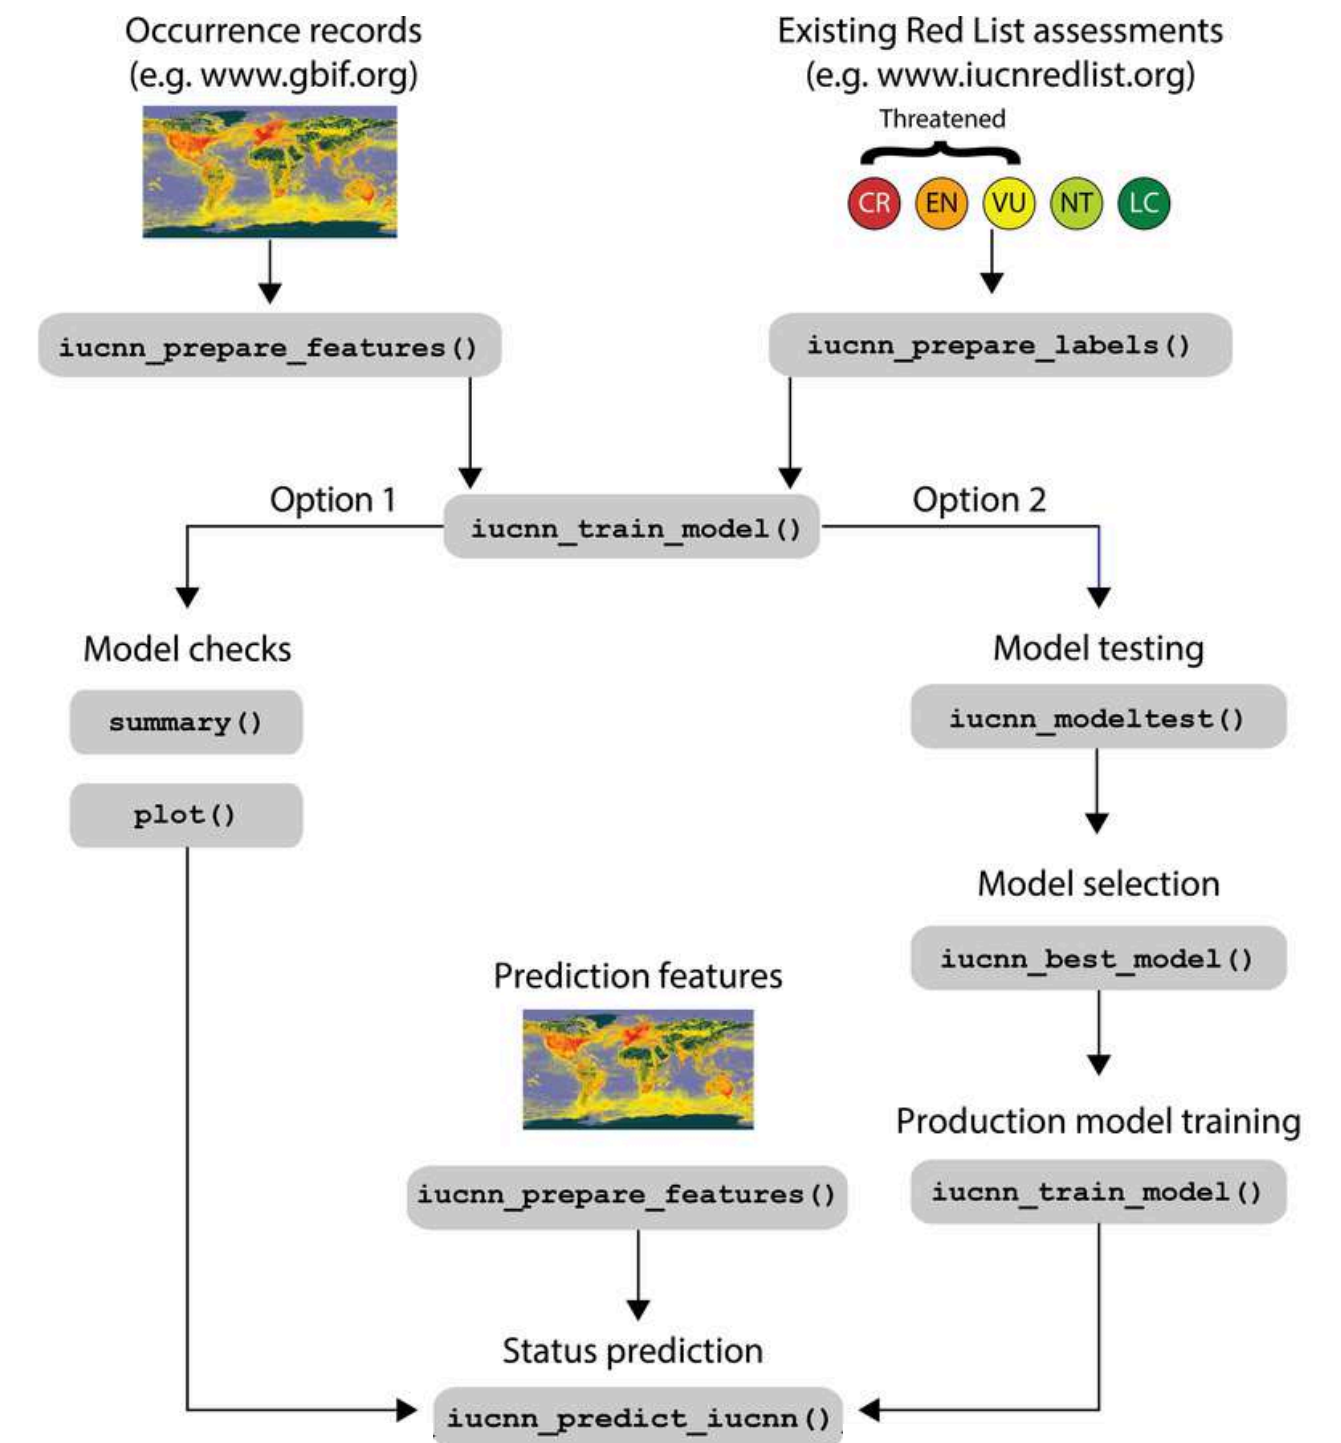

Critical Gaps:

- <10% of species assessed globally
- Taxonomic bias (focus on vertebrates)
- Geographic bias (underrepresentation of biodiversity hotspots)
- Time- and data-intensive

AI-BASED RISK PREDICTION

Data Workflow

- Used only species classified in CR EN & VU categories
- Features: range size, climatic niche, human footprint, biome occupancy
- Retained only high-confidence predictions using Monte Carlo dropout
- Final selection: species flagged as “at risk” by ≥ 3 models (elbow threshold)

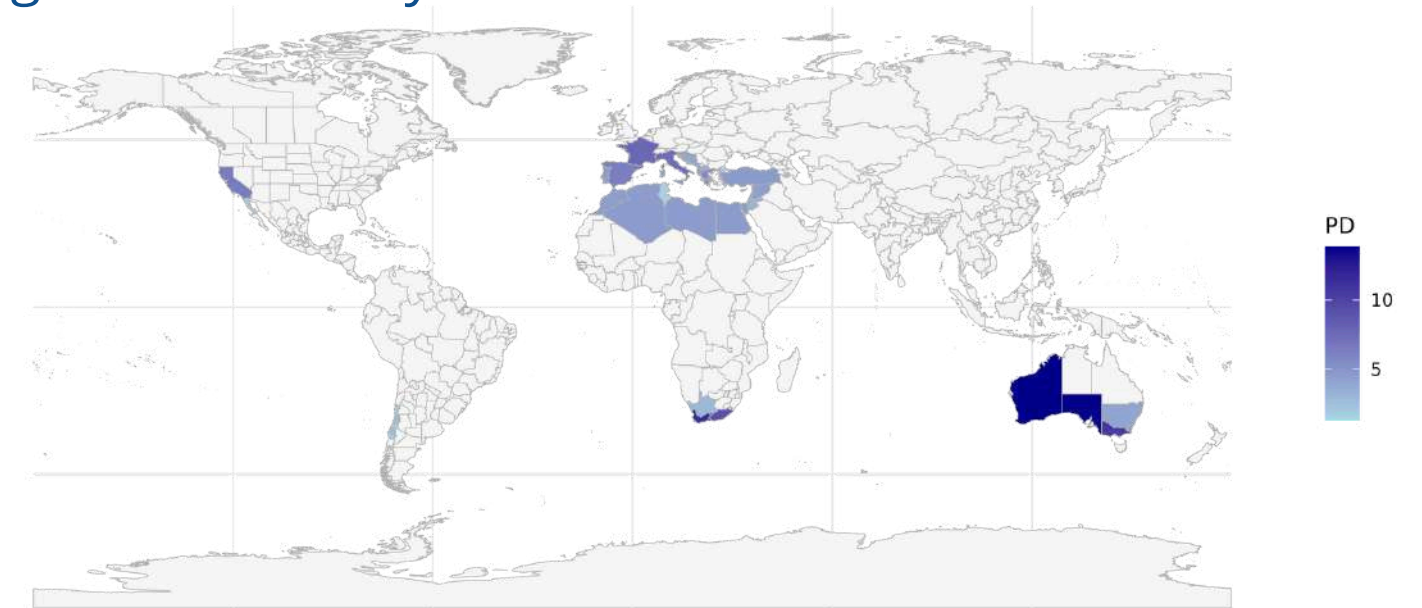

RESULTS

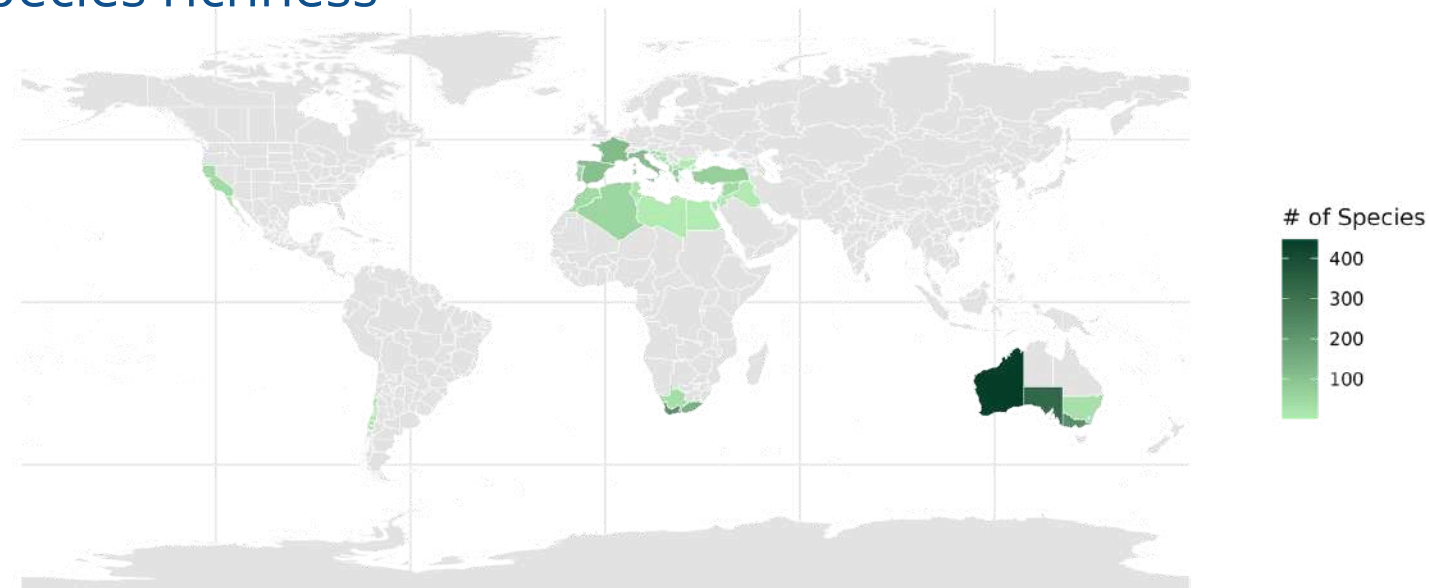

1264 species

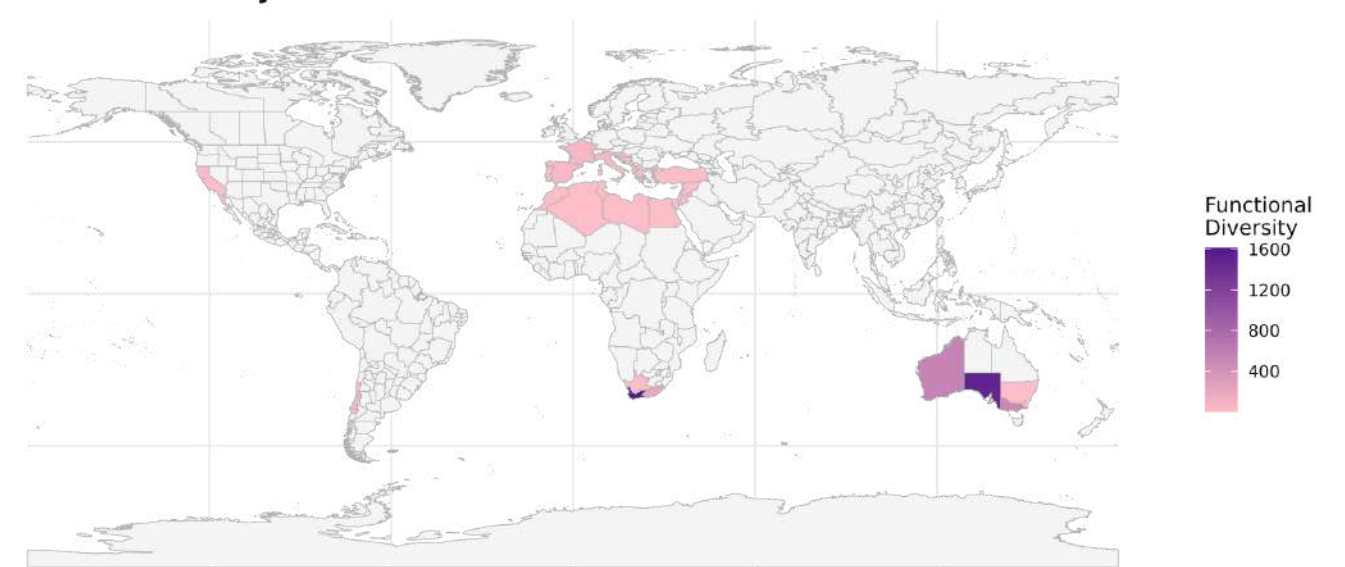

Phylogenetic diversity

Species richness

Functional diversity

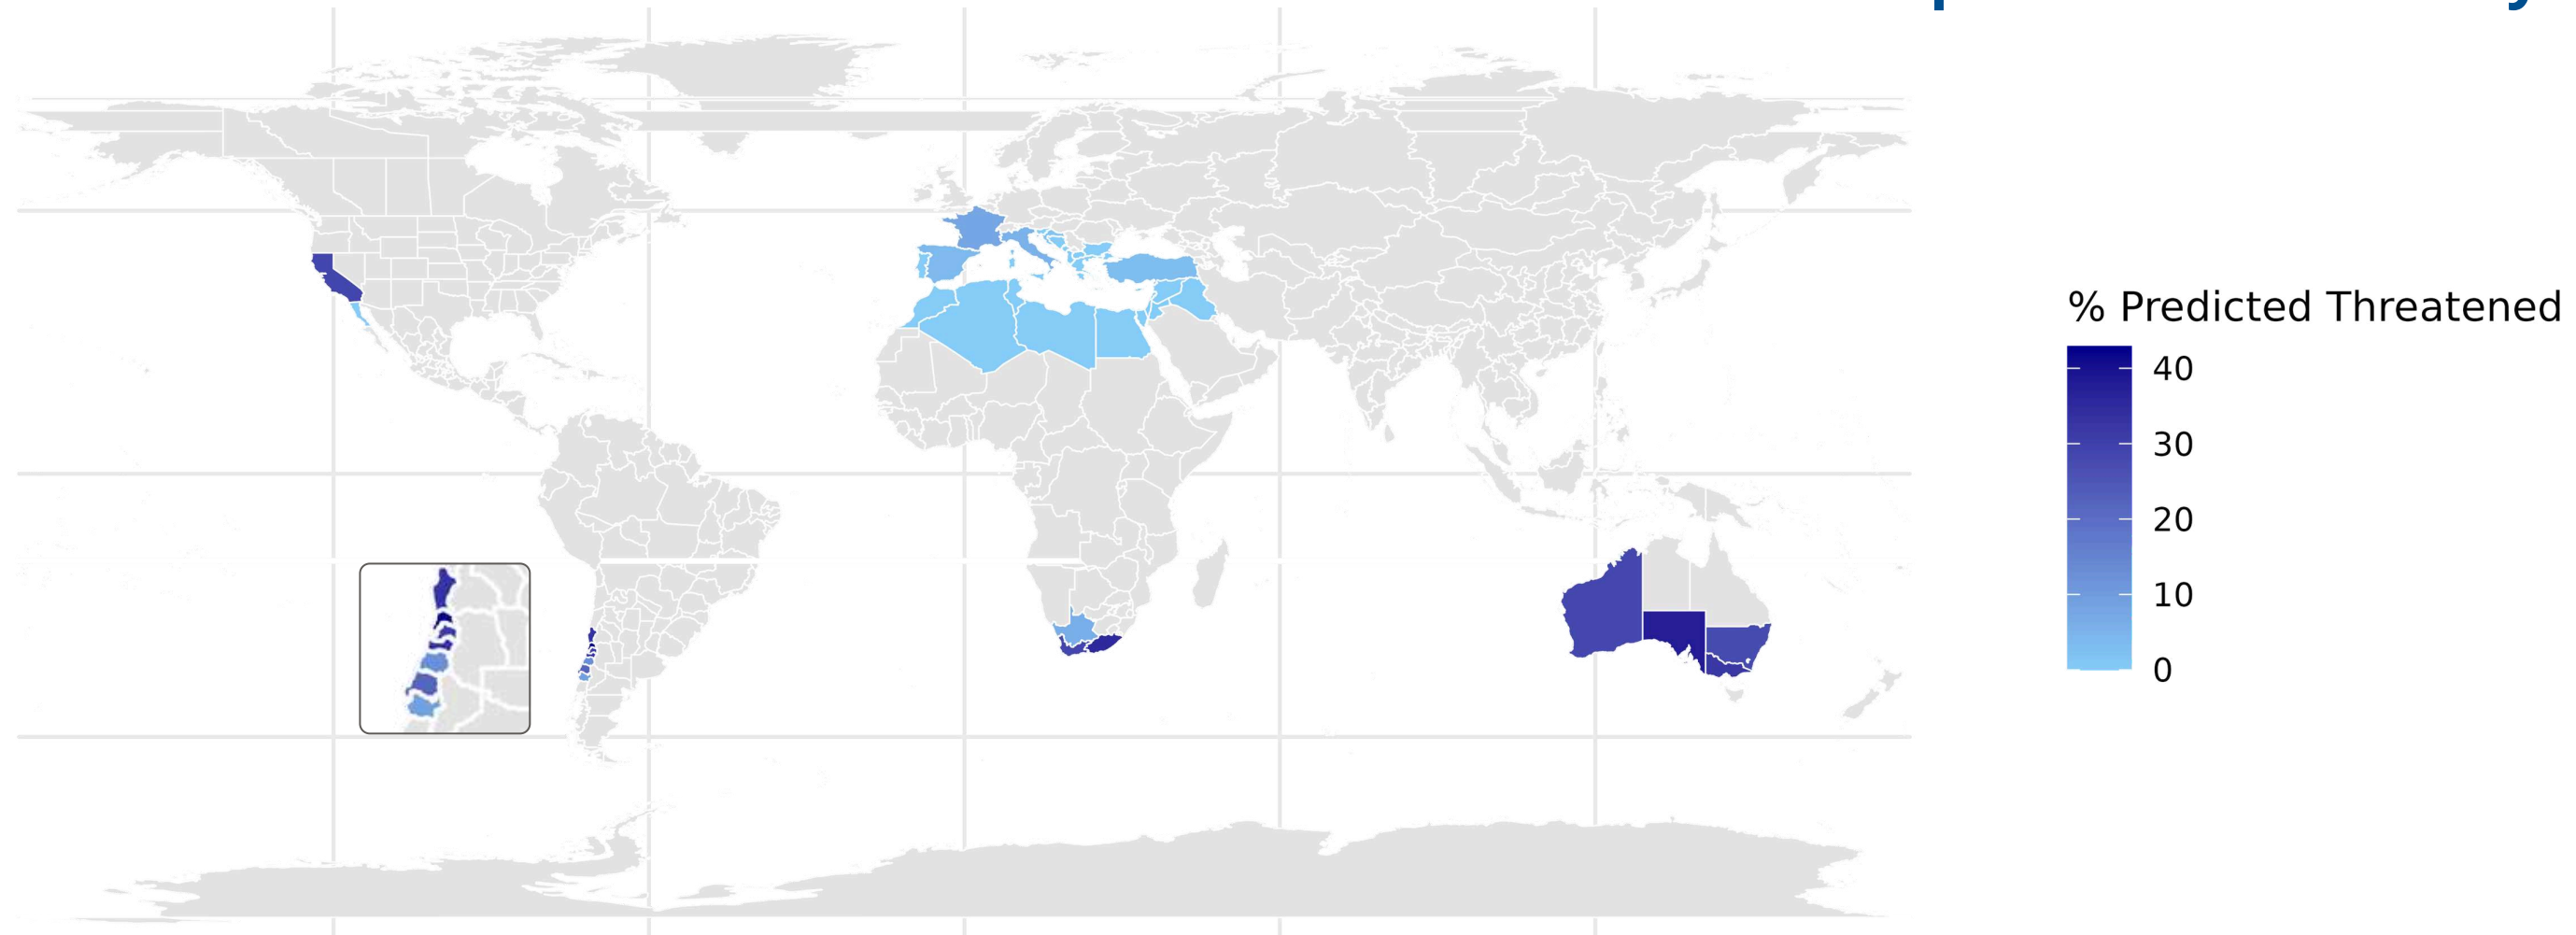

There is a highly significant difference between biodiversity metrics. **This result shows that the distributions of PD, FD, and SR within MB are not equivalent.**

DL-BASED RISK PREDICTION

IUCN assessment: NA 92%, LC 4.6%, NT 1.1%, VU 0.7%, EN 0.7%, CR 0.6%

1160
species evaluated by DL

438 (34.6% of total) species predicted as threatened

Discussions

- SR, FD and PD shows different patterns
- **34.6%** of orchid species are predicted as threatened **VS 2,4%** already assessed
- **The % of predicted threatened species varies accross Mediterranean botanical countries**

Take-Home Messages

- Integrating **taxonomic, functional, and phylogenetic perspectives** is crucial for effective conservation.
- Deep learning emerges as a powerful ally for conservation biology, **enabling fast, scalable, to support assessments that traditional methods alone cannot achieve.**

Thank you!
